

Platelet Rich Plasma, or PRP, is a popular aesthetic treatment. This is due to its ability to naturally rejuvenate the skin and repair the signs of ageing by using our own platelet rich blood cells. While it may seem daunting to the uninitiated, PRP is actually very safe and has been used in the hospital system for decades.

WHAT IS PRP?

PRP is a form of cosmetic injectable treatment that uses the client's own platelet rich plasma. The plasma component **contains stem cells and growth rich platelets**. When injected back into the skin, it accelerates the body's natural production of collagen and elastin to provide overall skin rejuvenation.

HOW DOES IT WORK?

Our medical staff will draw a small sample of blood. This is then spun in a centrifuge for approximately five minutes to separate the plasma from the other blood particles. Lastly, the platelet rich plasma is then applied into the treatment area, stimulating collagen and elastin production.

WHAT DOES IT DO?

PRP has a number of benefits. The treatment can improve skin texture and tone, reduce fine lines and scarring, and stimulate collagen and skin cell production for a plumper, more radiant complexion.

WHO IS IT FOR?

PRP is great for anyone who is concerned by any areas of skin that are starting to lose elasticity and volume. It's also a highly effective method for stimulating your body's cells to produce new, healthy looking skin. It is extremely effective for that delicate under eye area where often clients notice signs of ageing first and where no laser can be used. It is also used to increase the structural integrity and health of the skin, particularly sun damaged skin.
